THE UNIVERSITY OF BRITISH COLUMBIA The 2023 wildfire season was the most severe in recorded Canadian history. Do you believe there will be an even more severe season in the next ten years?

- A. Yes
- B. No
- C. Maybe

15M 17 million hectares burned by the end of September 2023 10M 6.7 million 6.1 million 5M 4.2 million 4.2 million 2.9 million 2.9 million

How is exposure to wildfire smoke most different from exposure to other types of air pollution (e.g., vehicle exhaust or industrial emissions)?

A. It is more spatially unpredictable

- B. It is more temporally unpredictable
- C. The air quality impacts are higher in magnitude
- D. A and B
- E. All of A, B, and C

Number of days in 2010-2022 with high biomass smoke exposure 10-25 26-40 41-55 56-70 71-85 86-100 101-115 116-130 131-145 146-160+

Wildfire smoke is starting to dominate lifetime PM_{2.5} exposure

https://www.capradio.org/articles/2021/09/28/dangerous-air-we-mapped-the-rise-in-wildfire-smoke-across-america-heres-how-we-did-it/

Wildfire smoke is a complex mixture of organic and inorganic gases and fine particles with a complex composition. Which component of wildfire smoke is most relevant to human health?

- A. Inorganic gases (e.g., CO, NO_X , O_3)
- B. Organic gases (e.g., PAH, VOC)
- C. Fine particulate matter
- D. We don't really know

As they move away from the fire, the particulate matter (PM), volatile organic compounds, and other gases interact in the atmosphere to form secondary particles and gases, such as ozone.

> Fires emit microscopic soot particles that stick together to form larger particles.

> > 10 μm (PM10)

0.5 µm

*a*isolinestudios

Human hair for scale

2.5 µm (PM2.5)

~ 50 µm

Small particles travel deep into the lungs

- Blood In Alveoli CO₂ Out O₂ In Blood Out
- Inflammation

Acute effects on a smoky day $(100 \ \mu g/m^3 \ PM_{2.5})$

*Unpublished data

Respiratory Disease Mortality Stroke Respiratory Disease Morbidity Neurological development Lung Cancer Mental Health Pneumonia Neurodegenerative diseases Upper and lower respiratory symptoms Cardiovascular Disease Mortality Airway inflammation Cardiovascular Disease Morbidity Decreased lung function Myocardial Infarction Decreased lung growth Arrhythmia Congestive Heart Failure Insulin Resistance Changes in Heart Rate Variability Type 2 diabetes ST-Segment Depression Type 1 diabetes Bone metabolism Skin Aging High blood pressure Premature Birth Endothelial dysfunction Decreased Birth Weight Increased blood coagulation Decreased foetal growth Systemic inflammation In uterine growth retardation Deep Venous Thrombosis Decreased sperm quality Preclampsia

Rapid summary of acute wildfire smoke effects

Same	Different
How is wildfire smoke the same as other types of air pollution?	How is wildfire smoke different from other types of air pollution?
 Seems to affect every organ system in the body Magnitude of effect is similar for most health outcomes 	 Much stronger acute respiratory effects, especially for those with chronic conditions such as asthma

Does wildfire smoke affect our health even after the air has cleared?

- A. Yes
- B. No
- C. Probably

Chronic effects so far...

- Persistent reductions in lung function
- Increased cardiovascular disease (wildland firefighters)
- Higher healthcare use
- Subsequent severe acute events (e.g., MI)
- Mood and developmental disorders (e.g., PTSD)
- Lung, brain cancers

In the absence of more specific evidence, there is **NO REASON** to believe that exposure to wildfire carries less risk than other types of air pollution.

What factors make children more susceptible than adults to the effects of air pollution?

- A. Higher respiratory rate
- B. Higher activity levels
- C. More time outdoors
- D. Rapid lung development
- E. A and D
- F. B and C
- G. All of A, B, C and D

Eyeball epidemiology

Prenatal exposure in 2017 or 2018 — Prenatal exposure in 2016 or 2019

Real epidemiology

1997-1998 haze in Indonesia

- Strong El Nino cycle
- Exposed infants were
 >3 cm shorter than
 non-exposed infants
 as adults

WFS = Wildfire Smoke
IC = Inspiratory Capacity
ERV = Expiratory Reserve Volume
RV = Reserve Volume
FRC = Functional Residual Capacity
VC = Vital Capacity**
TLC = Total Lung Capacity

https://www.atsjournals.org/doi/full/10.1165/rcmb.2016-0380OC

What is the best way to protect adults and children (including those in the womb) from the effects of wildfire smoke?

- A. Staying indoors
- B. Using indoor air cleaning strategies
- C. Wearing masks
- D. Reducing activity levels outdoors
- E. Monitoring air quality at home

"It's natural!"

"It's unsafe."

"It's a form of air pollution that can affect your health. The more you reduce your exposure, the more you reduce the risks." The 2023 wildfire season was the most severe in recorded Canadian history. Do you believe there will be an even more severe season in the next ten years?

- A. Yes
- B. No

C. Maybe
